

# Grodan Grofit

Product data sheet

Grodan Grofit is a porous substrate based on NG2.0 stone wool cubes covered with a solid stone wool disc. It has proved itself as a stable and reliable growing medium for gerbera. The plants are anchored firmly in their pots from day one, making harvesting a lot easier. Grodan Grofit guarantees rapid resaturation, intensive root penetration and homogeneous,

vigorous crop development. The excellent root penetration forms the basis for a vigorous plant that gets off to a strong vegetative start and is more resistant to diseases. Regardless of light conditions and the outside climate, a crop grown on Grofit is always easy to steer in a vegetative or generative direction. This results in noticeably higher yields of top-class flowers.

# Grodan Grofit

The stable and reliable growth medium for the cultivation of gerbera.

## Product characteristics

Modern gerbera growing demands a lot from both plant and substrate. It calls for a growing medium that has an excellent air/water ratio and a wide control range and that will retain its structure in the long term. In Grodan Grofit gerberas quickly develop a strong root system, so they grow more rapidly and more vigorously and perform better all year round.

## NG2.0 Technology

NG2.0 is the successor of the Next Generation Technology and adds new benefits to the existing advantages. Water distribution is even more uniform and the crop utilises the total substrate volume better. Continual new growth of roots in both the block and the slab results in a healthier and more vigorous crop throughout the whole growing season. The technology is available in plugs, blocks and slabs.

### Product specifications

- Porous bottom layer (Grocube 1x1x1 cm) with solid top layer
- Suitable for multi-year use
- Inert, hydrophilic fibers

### Key benefits

- Vigorous, vegetative start
- Fast root development, more growing power
- Steering across all seasons
